NSIGHT SEARCH

What does your company/product do?

nSight Search was born out of the need to cut down the overly broad privilege terms and from legal teams looking to simplify the measurement of precision and recall of specific search terms in a cyber incident response matter. nSight Search supplies dynamic results from the application of standard search terms by identifying the number of times a search string appears in each document.

How is your company/product changing the way law firms/legal departments operate?

Document-level search results enable legal teams to track down specific documents where a search hit occurred, leading to a document-by-document review of the results. Legal teams have used this solution to help narrow search terms during negotiations, to identify a denser population of documents, to cut down the review population, and as a tool for more targeted review. It allows legal teams to identify terms that hit on a few documents overall but appear too often in the document to make them meaningful. It also allows them to identify terms that potentially hit in every document but only appear once, thus rendering them too broad. Furthermore, this feature allows for easier calculation of the efficacy of performance for a particular search term.

How is your company/product different from others in the market?

One aspect differentiating nSight Search is the calculation of the density score assigned to each document, allowing the legal case team to evaluate documents with the highest density score first in the review. This feature is especially useful in cases involving PII and PHI elements, as it prioritizes documents containing the most PII and PHI upfront, guaranteeing the most important elements are handled first.
